

Don't give away secrets with that old PC!

If you think delete means delete, think again. Just because you delete your data, doesn't mean that it's deleted from your PC hard drive! When you hit the delete button, the data still resides on your PC. It's like removing the labels from folders in a filing cabinet...the information still exists but is not prominently displayed. Electronic data, including email, has completely transformed communications these days, whereby almost everyone, business and home PC users alike, store critical data on their PCs.

Data Security Solution

Keep your data secure! Using dedicated software enables us to easily, quickly and permanently delete all of the personal, confidential and critical data on your hard drive. It permanently deletes the information by actually overwriting all of the data on your hard drive - never to be recovered - so you can feel confident that sensitive information is completely eliminated. It's fast, flexible, easy to use, and best of all; it helps you maintain control of your confidential information.

What happens to this data when it's time to get rid of your PC? The old PC and all of the data on it end up in other people's possession whether your PC is being donated, recycled or transferred to another user. How important is it to keep your data from being placed in the hands of unknown users? Consider all of the data that is stored on your PC and YOU decide:

- Financial data
- Email
- Internet History
- Personal documents
- Sales contact information
- Product development plans
- Marketing plans
- Trade secrets
